CHALLENGE OVERVIEW

WHAT YOUR AGENT MUST DO

CORE TECHNICAL REQUIREMENTS (PART 1)

01

GOAL-DIRECTED AUTONOMY

Accept high-level goals

Plan independently

Handle ambiguity

Adapt dynamically

02

MULTI-TOOL INTEGRATION

Minimum 3 tools/APIs

External data sources

Decide which tool to use

Interpret outputs intelligently

CORE TECHNICAL REQUIREMENTS (PART 2)

03

HUMAN-IN-THE-LOOP

HUMAN REVIEW POINT

A deliberate point where a human reviews the agent's planned action.

REDIRECT ACTIONS

Guide the agent to a different path when needed.

OVERRIDE DECISIONS

Override or stop actions that don't align with your judgment.

MEANINGFUL CONTROL MECHANISM

A thoughtful control layer that adds real value and ensures reliability.

AUTONOMY WITH CONTROL

Humans stay in control at the right moments.

04

TRANSPARENT DECISION TRAIL

EXPLAIN EVERY ACTION

Provide clear explanations for every decision made.

SHOW REASONING

Reveal the thought process, assumptions, and logic behind each step.

DISPLAY TOOL OUTPUTS

Show inputs, tool calls, and raw outputs used in the process.

TRACE ENTIRE WORKFLOW

Allow full end-to-end traceability from input to final output.

DECISION TRAIL

01

USER GOAL

Find potential suppliers for eco-friendly packaging.

02

TOOL USED

Web Search API

Searched for suppliers in eco-friendly packaging.

OUTPUT:
25 results found

03

TOOL USED

Database API

Filtered suppliers by region, rating and certifications.

OUTPUT:
8 candidates found

04

DECISION MADE

Selected top 3 suppliers based on rating, price and sustainability.

05

FINAL OUTPUT

Generated comparison report and recommendations.

FULL VISIBILITY. FULL TRUST.

Judges can trace the agent's entire reasoning without reading the source code.

STACK & TECHNICAL RULES

✓ ALLOWED

- Python
- TypeScript
- Go
- OpenAI
- Anthropic
- Gemini
- CrewAI
- LangChain
- AutoGen
- LlamaIndex
- APIs
- Databases
- Vector Stores

✗ NOT ALLOWED

- Agent-as-a-Service Platforms
- No-code AI Builders
- Vendor Agents
- Black-box Autonomy

THE CORE TEST

CAN YOU EXPLAIN YOUR AGENT?

These are the core questions judges will ask.

WHAT MAKES IT AUTONOMOUS?

Explain the core mechanisms that enable your agent to act independently.

HOW DOES THE AGENT LOOP WORK?

Walk us through your agentic loop, step-by-step. What triggers the next action?

HOW DOES IT CHOOSE TOOLS?

How does your agent decide which tool to use, when to use it, and why?

HOW DOES IT RECOVER FROM FAILURES?

How does your agent handle errors, unexpected results, or tool failures?

CLARITY. DEPTH. TECHNICAL EXPLANATION.

Judges want to understand your thinking, not just see your output.

WHAT WILL NOT SCORE WELL

01

CHATBOT ONLY

If a human needs to continuously ask it questions and interpret the answers to take action, it is not an agent. Agents act; chatbots respond.

02

FIXED PIPELINE

If your agent always executes the exact same steps in the same order regardless of what it finds, it is a pipeline, not an agent. Real agents branch, retry, and adapt.

03

SINGLE API CALL

Calling one external service and formatting the output is not multi-step reasoning. Judges will ask to see your tool use logs.

04

UNEXPLAINED AI CODE

If your code was generated wholesale by an AI assistant and you cannot articulate how your agentic loop works, how it handles failure, and why you made the architectural choices you did, you will not score well.

05

FAKE DEMO

If your live demo uses hardcoded or pre-fetched data presented as live reasoning, judges will catch it. Bring real inputs to your final demo.

Judges expect genuine autonomous reasoning—not scripted workflows.

JUDGING CRITERIA

SUCCESS CHECKLIST

- ✓ Autonomous Agent
- ✓ Dynamic Decision Making
- ✓ 3+ External Tools
- ✓ Human Oversight
- ✓ Transparent Reasoning
- ✓ Clean Architecture
- ✓ Live Demo Ready

THANK YOU !
